

Problem

Our client, a nonprofit managed care organization, recently joined four other health systems in assuming shared risk for a new Medicaid population. They needed to analyze a large volume of provider data to identify how to reduce the total cost of care, but lacked an internal resource with the necessary data analysis skills. Additionally, they wanted to formulate value-based contract strategies for providers identified as strong opportunities for expansion and growth.

Response

Jacobson quickly provided an experienced data analyst who completed the requested work using SAS and SQL with minimal client oversight or direction. This individual possessed an extensive background in **business intelligence, reporting and provider reimbursement**.

Solution

Our consultant was tasked with creating benchmarks and identifying trends, groupings and opportunities to most cost effectively partner with our client's provider community. Ultimately, our client's goal of completing the data review within three months was met; and our consultant presented the findings directly to their senior leadership team. Our client was extremely **impressed by the quality of work provided** and the consultant's willingness to assist with additional tasks as requested.

Data Analytics

Provider Analytics Consultant

Client Type: Nonprofit Managed Care Organization

Project Scope: Data Analytics

Duration: 3 Months

Team Size: 1 Full-Time Employee
